Study Methodology

This survey was conducted by NORC at the University of Chicago with funding from the Robin Hood Foundation. Staff from NORC at the University of Chicago and New Practice Lab, and the Robin Hood Foundation collaborated on all aspects of the study.

Interviews were conducted March 31-April 20, 2026, with 4,306 New York City adult residents age 18 in the U.S. with children ages 0-5.

Data for the probability-based sample are collected using an address based (or ABS) approach that allows residents to complete the interview via web. The sampling frame is based on an extract of the U.S. Postal Service delivery-sequence file (DSF). The DSF provides sample coverage of approximately 97% of the U.S. household population. Those excluded from the sample include some addresses not listed in the USPS Delivery Sequence File, and some newly constructed dwellings. Addresses were limited to the five boroughs of New York City and stratified by the likelihood that the household included a child aged 0–5 years. Addresses with a higher likelihood of having young children were oversampled.

All sampled households are mailed a postcard inviting them to complete the survey online using a unique PIN. Phone numbers were obtained from consumer records matched to the address from Verisk, and those who did not respond to the postcard were texted to complete the survey via a direct link. Postcards are addressed to: CURRENT RESIDENT. There is no within-household selection for households with multiple adults.

Probability interviews were conducted online, with 1,372 completing via web. Interviews were conducted in English and Spanish, and respondents were offered a monetary incentive for completing the survey.

Cint provided 1,149 non-probability interviews with parents of children ages 0-5 living in New York City. Interviews were conducted in English and Spanish, and via the web only. For panel recruitment, Cint uses invitations of all types including email invitations, phone alerts, banners, and messaging on panel community sites to include people with a diversity of motivations to take part in research.

Additional non-probability sample was collected via an open link where respondents could provide their email address and key demographic and geographic information. Sample was collected via this open link from March 31 through April 17. Any duplicate email addresses were removed, and all eligible respondents were then emailed a direct link to complete the survey. Early respondents to the open link survey but nonresponders to the main survey were sent a follow up email. Interviews were conducted via web in English and Spanish, and 1,785 completed the survey.

Because non-probability panels do not start with a frame where there is known probability of selection, standard measures of sampling error and response rates cannot be calculated.

Quality assurance checks were conducted to ensure data quality. In total, 116 interviews were removed for nonresponse to at least 50% of the questions asked of them, for completing the survey in less than one-third the median interview time for the full sample, or for straight-lining all grid questions asked of them. These interviews were excluded from the data file prior to weighting.

In order to incorporate the nonprobability samples, NORC used TrueNorth calibration, an innovative hybrid calibration approach developed at NORC in order to explicitly account for potential bias associated with the nonprobability sample. TrueNorth uses a tree-based non-parametric supervised learning algorithm to classify respondents based on their survey responses and apply a ratio adjustment to adjust the weights for the nonprobability sample to bring weighted distributions of the nonprobability sample in line with the population distribution. Such calibration adjustments help to reduce potential bias, yielding more accurate population estimates. A raking process is also used to adjust for any survey nonresponse as well as any noncoverage or under and oversampling resulting from the study sample design. Raking variables included age of parent, gender of parent, household income, race/ethnicity, education of parent, housing tenure (own, rent/other), age(s) of child(ren) in the household, language most spoken in household, and borough. Population control totals for the raking variables were obtained from the 2024 American Community Survey. The weighted data reflect the New York City population of parents and caregivers of children ages 0-5.

The overall margin of error for the combined sample is +/- 3.1 percentage points at the 95 percent confidence level, including the design effect. The margin of sampling error may be higher for subgroups.

Sampling error is only one of many potential sources of error and there may be other unmeasured error in this or any other survey.

For the open-ended questions (Q11, Q32_2, Q39A, Q39B, and Q42), responses were initially classified using Microsoft Copilot. These codes were reviewed, validated, and adjusted as needed by a human coder for reporting.

Complete questions and results are available at <https://www.norc.umd.edu/research/projects/understanding-child-care-needs-new-york-city-families.html>.

About NORC at the University of Chicago

NORC at the University of Chicago conducts research and analysis that decision-makers trust. As a nonpartisan research organization and a pioneer in measuring and understanding the world, we have studied almost every aspect of the human experience and every major news event for more than eight decades. Today, we partner with government, corporate, and nonprofit clients around the world to provide the objectivity and expertise necessary to inform the critical decisions facing society.

For more information, visit [norc.org](https://norc.uchicago.edu).
